

#### **Energy and Carbon Intensity of Buildings**

#### **CARBON IMPACT OF BUILDINGS**

- Material resources extraction and processing for production leading to deforestation, loss of top soil
- Transportation of raw materials and finished products
- Operational energy of buildings for comfortable indoor environments

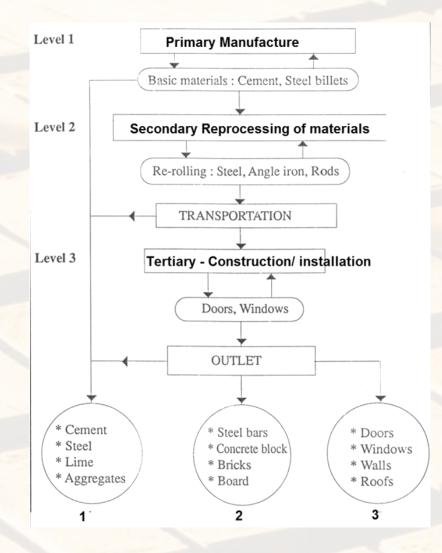

At the national level, activities of the construction sector Emission of about 22% of the total annual national CO<sub>2</sub> emissions (80% results mainly from production of energy intensive building materials - steel, cement, bricks and lime)

### **Embodied Energy**

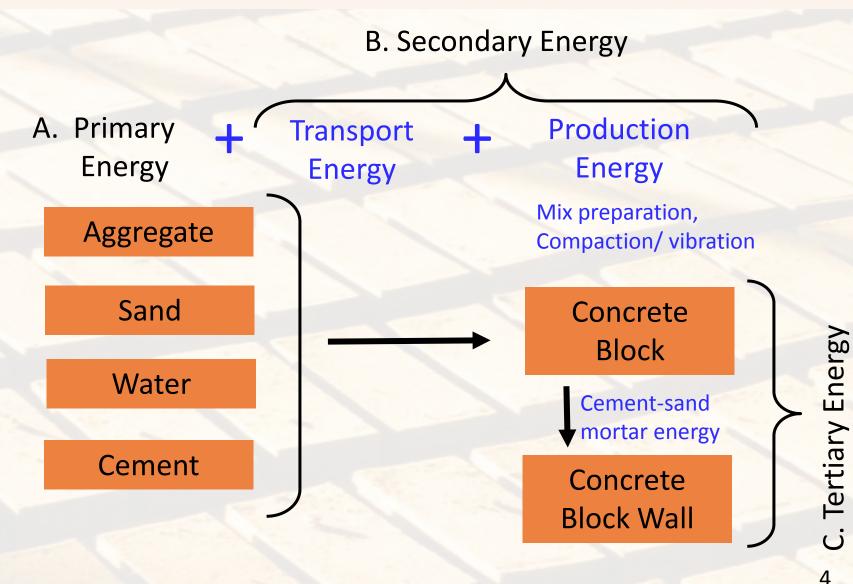

A summation of energy consumed in manufacture of raw materials, re-processing for producing building elements and in construction. (Commonly measured in Joules, kWh)

## Embodied energy can be significantly reduced by

- Combining raw materials in a way that optimizes durability at low embodied energy
- Designing construction systems in a way that structural requirements are met, using low embodied energy

#### **Embodied Energy of a Concrete Block Wall**

# At secondary level – measured per weight of building component (kg, Tonne)

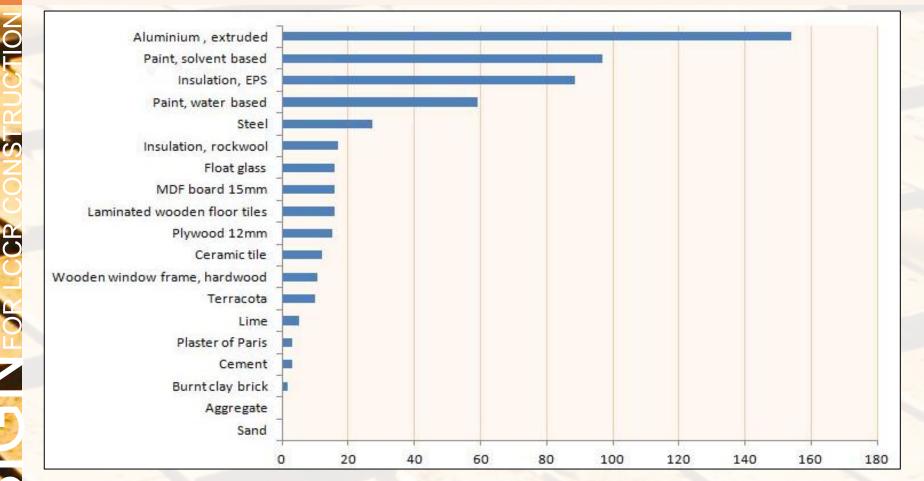

**BRICK:** Weight of brick – 2.2 kg Weight of 1000 bricks – 2200 kg Coal required for 1000 bricks – 140 kg Energy Content of coal 27.5 MJ/kg EE of 1000 bricks - 140 x 27.5 = 3850 MJ EE of 1 brick = 3.85 MJEE of brick = 3.85 / 2.2 = 1.75 MJ per kg

At tertiary level – measured per quantity of wall, roof constructed – MJ/m<sup>2</sup>

9" wall with burnt clay bricks

Number of bricks in 1m<sup>2</sup> wall 116 Weight of bricks in 1m<sup>2</sup> wall 250 kg **EE of bricks in 1m^2 wall** 250 x 1.75 = 445 MJ Mortar volume in 1m<sup>2</sup> wall 0.07 m<sup>3</sup> Mortar weight in 1m<sup>2</sup> wall 0.07 x 2080 kg/m<sup>3</sup> = 145 kgEE of mortar in 1m<sup>2</sup> wall 145 x 0.75 = 108 MJ  $EE of 1m^2 brick wall = 108 + 445 = 553 MJ$ 

#### **Embodied Energy**

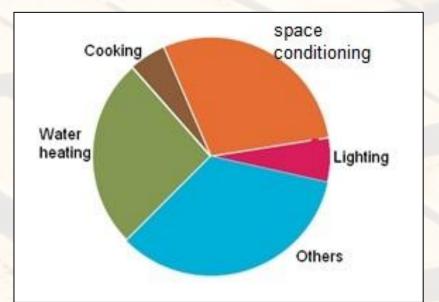

Generally, for low-rise buildings which use bricks and RCC roofs -

- Bricks and steel are the top 2 contributors to total embodied energy
- Bricks and cement are the top 2 contributors to CO<sub>2</sub> emissions

#### **Operational Energy**

Energy used for day-to-day operation - lighting, heating, ventilation, air-conditioning (HVAC), use of appliances, water pumping, etc.

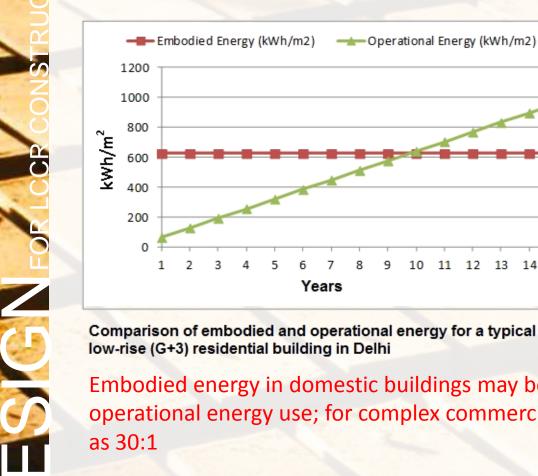

Electricity Consumption in Residential Buildings While electrical appliances determine operational energy in urban areas, cooking and lighting are the primary energy consumers in rural areas.

Measured as Energy Performance Index (EPI) expressed in kWh/m2/annum.

EPI of conventional residential buildings in Composite climate with significant cooling loads is 50 – 60 kWh /m2/ annum

#### **Embodied Energy vs. Operational Energy**

12

Years

13

14 15

———Operational Energy (kWh/m2)

Embodied energy in domestic buildings may be equivalent to 10 times annual operational energy use; for complex commercial buildings, the ratio can be as high

#### Carbon Footprint

#### **Carbon Footprint is...**

The total set of GHG emissions caused directly.

Globally, Carbon footprints are a tangible parameter to assess environmental impact in terms of mass of emissions and a means of promoting Low-Carbon practices.

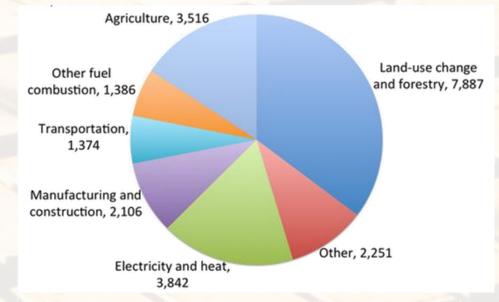

Chart showing carbon dioxide emissions (Million Metric tonnes) by source for developing countries, 2000. Image courtesy of Little Green Data Book 2007

For buildings, it is acceptable to assume CO<sub>2</sub> as the primary GHG emission arising from 2 causes -

- Production of materials and their consumption in building construction
- Emissions from electricity use to maintain comfortable indoor environments

## CARBON FOOTPRINT – Calculation for Brick Masonry

Total CO <sub>2</sub> emissions of burnt clay brick masonry(4+5)	69 kg CO <sub>2</sub> / m <sup>2</sup>
CO <sub>2</sub> emissions due to cement used in mortar (=1.83 x 15.5)	28.4 kg (5)
CO <sub>2</sub> emissions per tonne of cement produced	1830 kg
CO <sub>2</sub> emissions due to bricks (= 140/1000 x 120) x 2.42	40.65 kg (4)
CO <sub>2</sub> emissions per kg coal	2.42 kg

## Thank you
